

What is Perimeter Insect Control?

Perimeter Insect Control is a liquid application of insecticide designed to place a protective barrier around your home.

To help prevent infestation, a barrier of soil four to six feet around the structure, as well as two to three feet up the foundation walls, are treated. These areas are where insects are generally most active and where they may find entrance to your home.

The All American Turf Beauty Perimeter Insect Control Program is on a three or four times per year application schedule that you can order now.

What are the advantages of Perimeter Insect Control?

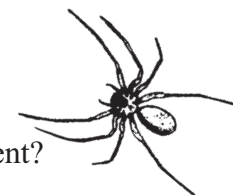

- Insects are controlled before they enter your home.
- Pesticide applications are made outside of your home—not inside.
- Minimizes the need for interior pest control.

Are you tired of:

- Ants in the kitchen?
- Spiders on the walls?
- Crickets in the basement?
- Fleas, mites, and other pests in the carpet, furniture and on your pet?

All these insects live outside and enter your home through foundation cracks and crevices, window wells, etc. Perimeter Insect Control will keep these pests away from your house and significantly reduce their occurrence inside your home.

How can you help?

Successful control of “home invaders” requires the cooperation of the homeowner. Here are some ways you can help our spring, summer, and fall treatments:

- Check caulking around exterior structure including window casings.
- Place exterior lighting as far from structure as possible.
- Keep garbage cans tightly covered.
- Avoid stacking firewood on the ground near the structure.
- Check sealing of entry points including those around plumbing, electrical wiring, and etc.
- Make certain all soffits and wall vents are properly screened.
- Be certain that all ground level doors seal properly.

Insects Controlled*

Ants	Millipedes
Bee's	Mosquitoes
